1 Introduction

`diction` finds all sentences in a document that contain phrases from a database of frequently misused, bad or wordy diction. It further checks for double words. If no files are given, the document is read from standard input. Each found phrase is enclosed in [] (brackets). Suggestions and advice, if any, are printed headed by a right arrow ->. A sentence is a sequence of words, that starts with a capitalised word and ends with a full stop, double colon, question mark or exclamation mark. A single letter followed by a dot is considered an abbreviation, so it does not terminate a sentence. Various multi-letter abbreviations are recognized, they do not terminate a sentence as well, neither do fractional numbers.

`diction` understands `cpp #line` lines for being able to give precise locations when printing sentences.

There has been a `diction` command on old UNIX systems, which is now part of the AT&T DWB package. The original version was bound to `roff` by enforcing a call to `deroff`. This version is a reimplementaion and must run in a pipe with `deroff` if you want to process `roff` documents. Similarly, you can run it in a pipe with `dehtml` or `detex` to process HTML or TeX documents.

2 Invoking `diction`

```
'-b'
'--beginner'
    Complain about mistakes typically made by beginners.

'-d'
'--ignore-double-words'
    Ignore double words and do not complain about them.

'-s'
'--suggest'
    Suggest better wording, if any.

'-f file'
'--file file'
    Read the user specified database from the specified file in addition to the default
    database.

'-n'
'--no-default-file'
    Do not read the default database, so only the user-specified database is used.

'-L language'
'--language language'
    Set the phrase file language.

'-h'
'--help'    Print a short usage message.
'--version'
    Print the version.
```

2.1 Environment Variables

Diction's behaviour is affected by the following environment variables.

LC_MESSAGES

This variable specifies the `LC_MESSAGES` locale, which determines the language that `diction` uses for messages. American English is used if the environment variable is not set, or if the message catalog is not installed, or if `diction` was not compiled with national language support (NLS). The variable is further used as default for the phrase language.

2.2 Files

`$prefix/share/diction`

This directory contains phrase databases for various languages.

3 Diagnostics

If no errors occur, exit status is 0. On usage errors, 1 is returned. Termination caused by lack of memory is signalled by exit code 2.

4 Reporting Bugs

If you find a bug in `diction`, please send electronic mail to michael@morja.de. Include the version number, which you can find by running `diction --version`. Also include the hardware and operating system, the compiler used to compile 'diction', a description of the bug behavior, and the input to 'diction' that triggered the bug.

Concept Index

This is a general index of all issues discussed in this manual, with the exception of the `diction` command-line options.

C

complain about typical mistakes of beginners 1

D

do not complain about double words..... 1

E

environment variables 2

F

files 2

L

language of messages 2

M

message language 2

N

national language support 2

NLS 2

not loading default database..... 1

P

print usage message 1

print version 1

S

set phrase file language..... 1

suggest better wording 1

T

translation of message language 2

U

user specified database 1

Index

This is an alphabetical list of all `diction` command-line options and environment variables.

-	-d	1
--beginner	-f	1
--file	-h	1
--help	-L	1
--ignore-double-words	-n	1
--language	-s	1
--no-default-file		
--suggest	L	
--version	LC_MESSAGES	2
-b
