

NAME

UnRTF – converts document in RTF format to other formats

SYNOPSIS

unrtf [*options*] [*file...*]

Options: [**--nopict**] [**--html**] [**--text**] [**--vt**] [**--latex**] [**--ps**] [**--wpml**] [**--help**] [**--version**]

DESCRIPTION

The program **unrtf** is a converter from Rich Text Format (RTF) to a growing number of document formats. At present it supports Hypertext Markup Language (HTML), plain text, text with VT100 codes, LaTeX, and PostScript. All output formats except HTML are "alpha" i.e. limited and development has just begun. However with HTML, the program supports tables, fonts, embedded images, hyperlinks, and paragraph alignment. Font support includes face and size changes, as well as typical attributes such as italic, bold, underlining, strikethrough, smallcaps, allcaps, expand, compress and both foreground and background colors. Images are always stored to separate files in the current directory, or they can be ignored.

OPTIONS

- nopict**
disables the automatic storing of embedded pictures to the current directory.
- html** selects HTML output (default).
- text** selects plain ASCII text output.
- vt** selects text output with VT100 escape codes.
- latex** selects output of a LaTeX document.
- ps** selects PostScript output.
- wpml**
selects WPML output.
- version**
prints the program version.
